EDUCATION

Year	Degree/Exam	Institute
2026	B.Tech.(Hons.) & M.Tech. Dual Degree in Metallurgical and Materials Engineering	IIT Kharagpur

WORK EXPERIENCE

Software Developer - Pruning Labs Jan 2026 – Present

- Built full-stack SaaS platforms using Next.js, TypeScript, and PostgreSQL, deploying scalable serverless edge handlers on Cloudflare Workers
- Implemented multi-tenant Role-based access control (RBAC) authorization and database schema migrations in PostgreSQL
- Configured GitHub Actions CI/CD workflows for automated TypeScript compilation, ESLint validation, and automated edge worker rollouts

Full Stack Software Engineer - Epek Software Solutions Oct 2025 – Jan 2026

- Decreased MongoDB query latency by 97% (850ms to 25ms) across high-concurrency endpoints by refactoring aggregation pipelines and compound indexes, reducing database CPU overhead and accelerating customer-facing analytics dashboard load times
- Scaled dealer-locator maps to 50,000+ locations using Leaflet spatial clustering and geofencing, maintaining 60 FPS viewport rendering, cutting initial payload size by 65%, and accelerating interactive location discovery for enterprise users
- Integrated real-time invoice synchronization with QuickBooks via event-driven webhooks, featuring exponential backoff and retry handling to eliminate transaction sync delays, guarantee idempotent payload processing, and maintain high audit accuracy
- Automated transactional invoice delivery using SendGrid email workflows with delivery status tracking, accelerating billing cycles and reducing outstanding accounts receivable across high-volume enterprise accounts with automated error alerts

Co-founder & Full-Stack Developer - Arcs Design Studio Jan 2025 – Oct 2025

- Engineered secure authentication flows across client applications using JWT session handling, multi-tenant RBAC, and OAuth2 social providers
- Built and deployed production web applications using Next.js, Node.js, and PostgreSQL, containerizing backend services with Docker on AWS EC2
- Automated microservice deployments on AWS EC2 using Docker containerization and GitHub Actions CI/CD pipelines with automated test suites
- Maintained production deployment pipelines on AWS EC2, configuring Nginx reverse proxies, SSL certificates, and Docker Compose configurations

INTERNSHIPS

Software Development Intern - Epek Software Solutions May 2024 – Jan 2025

- Engineered radius-based location search services using MERN stack, processing high-concurrency client API requests with sub-50ms latency
- Optimized MongoDB 2dsphere spatial queries and aggregation pipelines, significantly accelerating geospatial query execution and throughput
- Integrated Leaflet for interactive location discovery, client-side marker clustering, and real-time spatial data visualization on web maps
- Containerized backend microservices using Docker and Docker Compose, establishing reproducible local development environments for engineers
- Automated document processing for a social platform by developing a Python document parsing and text classification pipeline with validation

PROJECTS

SigNoz - Open Source Contribution github.com/SigNoz/signoz

- Resolved validation bypass in user onboarding flow by replacing asynchronous blur checks with strict pre-submission form validation logic
- Refactored authentication form state in React and TypeScript to derive validation reactively, eliminating redundant handlers and state bugs

Doist SDK - Open Source Contribution github.com/Doist

- Patched payload serialization and type safety in the Doist TypeScript SDK, improving API response handling across distributed endpoints
- Authored automated unit test suites using Jest covering malformed API responses, HTTP rate limits, and asynchronous network failure states

Motivecho - Competitive Intelligence SaaS motivecho.com

- Built distributed web crawlers using Cloudflare Workers, Queues, and Modal serverless Python (Playwright) to orchestrate headless browser sessions and capture full-page DOM snapshots across target enterprise domains with automated session recovery
- Engineered a noise-suppression diff engine using Jaccard similarity and regex tokenizers to filter dynamic CSS hashes, relative timestamps, and cookie banners, decreasing false-positive change alerts by 92% across recurring competitor crawls
- Implemented automated change-detection pipelines with AI summarization, delivering real-time notification alerts on competitor product changes
- Configured asynchronous crawl pipelines with dead-letter queue (DLQ) retry policies and distributed rate-limiting to prevent target IP bans

MicroMart - Distributed Microservices Backend github.com/belikedeep/MicroMart

- Built an event-driven microservices backend in TypeScript using NATS Streaming with queue groups and manual ACKs for at-least-once delivery
- Enforced Optimistic Concurrency Control using Mongoose versioning and sequential event querying to eliminate out-of-order race conditions
- Built a distributed worker using Redis and Bull Queue enforcing 15-minute order reservation locks and publishing auto-cancellation events
- Created a shared NPM library for typed events and error middlewares, authoring automated integration test suites with Jest and Supertest

Snapterra - Workflow & Asset Dashboard snapterra.vercel.app

- Built a digital asset dashboard featuring multi-part media uploads, smart link vaults, and interactive drag-and-drop Kanban workflow boards
- Integrated Groq LLM APIs to automatically extract metadata, generate document summaries, and classify incoming media assets with tagging
- Developed optimistic UI mutations using TanStack Query and integrated Stripe webhooks to automate subscription paywall access provisioning

SKILLS

- Languages:** TypeScript, JavaScript, Python, Go, SQL, Bash
- Frameworks & Libraries:** React, Next.js, Node.js, Express, TanStack Query, Leaflet, Tailwind CSS, Jest, Supertest
- Databases, Cloud & DevOps:** PostgreSQL, MongoDB, Redis, NATS, AWS (EC2, S3), Cloudflare Workers, Docker, Git, CI/CD, Nginx
